

Week 2

More sketches & component finalisation

Circuitry trials with a cardboard prototype

Cardboard prototype, MPU 6050 gyroscope testing and user testing to see how people hold the lightsaber

Making an acrylic tube in the lab

We first created a wooden cylinder (using a lathe, and then bent the acrylic around it

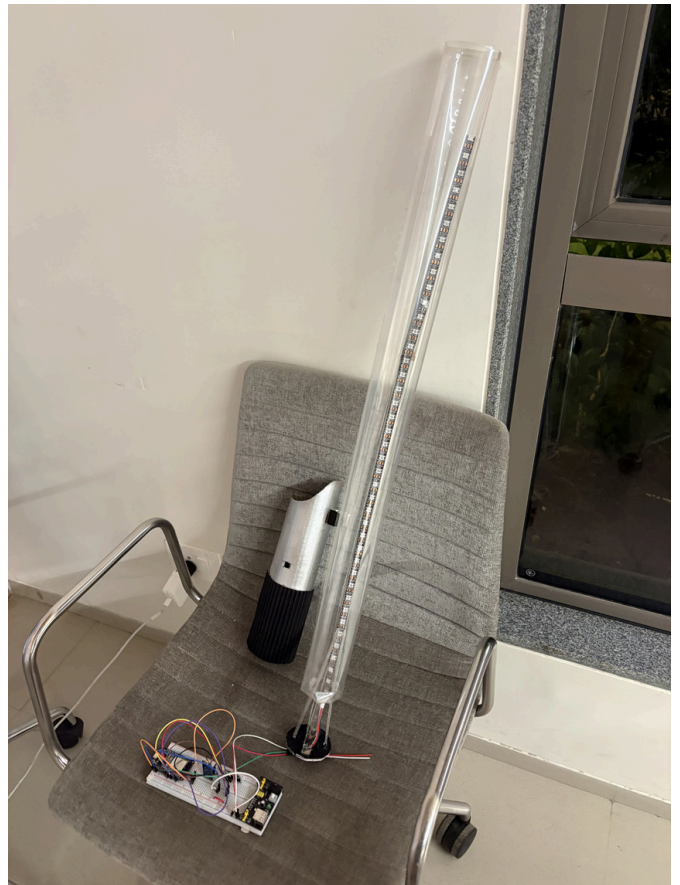

On making it, we realised it was too heavy to hold up but no 1mm acrylic sheet was available

Making the final hilt

Trouble-shooting the night before because our LDR sensitivity went rogue and push button stopped working when we stuck everything together

Final components

We had to use cellophane instead of the acrylic tube
We re-enforced the cellophane with acrylic sticks at the
bottom, attached to the sunboard
